GPU: Graphics Processing Unit

- A Integrated Circuit dedicated to graphics processing
- Uses an SIMD model (as this best suits Graphics programming)
 - Many "simple" cores
 - Cores contain many ALUs
- SIMT model now employed in GPUs

TABLE OF CONTENTS

- 1 DEFINITION
- 2 ARCHITECTURE
- 3 MEMORY MODEL
- 4 API's
- 5 EXAMPLES

- Different manufacturers have different architectures but in general terms:
- Each GPU has multiple Cores (simpler than CPU cores)
- Each Core has a number of SIMD units
- Each core is an SIMD processor

TABLE OF CONTENTS

- 1 DEFINITION
- 2 ARCHITECTURE
- 3 MEMORY MODEL
- 4 API's
- 5 EXAMPLES

- GPUs tend to be separate from CPU
- There is a cost to getting data from CPU to GPU
 - GPU and CPU have separate memory
 - must offload data to GPU before computation and then move result back to CPU at end
 - up to 10m instructions per offload
- Allowing GPU and CPU to share the same memory would change dynamics of GPU usage

MEMORY MODEL

Four types of memory in GPU

PRIVATE MEMORY Available only to single work item/SIMD unit

LOCAL MEMORY Local to workgroup/core

GLOBAL MEMORY Shared between entire GPU

CONSTANT MEMORY Read only memory

Much effort is put into fitting data to these memory sizes

TABLE OF CONTENTS

- 1 DEFINITION
- 2 ARCHITECTURE
- 3 MEMORY MODEL
- 4 API's**
- 5 EXAMPLES

From low level to high:

- OpenCL, CUDA
- ArrayFire, Thrust, C++ AMP
- OpenACC, OpenMP

APIs are in flux and changing (improving) year to year

5 Step Process

- Create a context within which the **kernel** will run with a command queue
- Compile the kernel
- Create buffers for input and output data
- Enqueue a command that executes the kernel once for each work item
- Retrieve the results

There can be a lot of boiler plate code but the kernel is the heart of the computation

TABLE OF CONTENTS

- 1 DEFINITION
- 2 ARCHITECTURE
- 3 MEMORY MODEL
- 4 API's
- 5 EXAMPLES

```
//kernel
__global__
void saxpy(int n, float a, float *x, float *y)
{
    int i = blockIdx.x*blockDim.x + threadIdx.x;
    if (i < n) y[i] = a*x[i] + y[i];
}

int main(void)
{
    int N = 1<<20;
    float *x, *y, *d_x, *d_y;
    x = (float*)malloc(N*sizeof(float));
    y = (float*)malloc(N*sizeof(float));
    cudaMalloc(&d_x, N*sizeof(float));
    cudaMalloc(&d_y, N*sizeof(float));
```

```
//later that day...
cudaMemcpy(d_x, x, N*sizeof(float),
           cudaMemcpyHostToDevice);
cudaMemcpy(d_y, y, N*sizeof(float),
           cudaMemcpyHostToDevice);
// Perform SAXPY on 1M elements
saxpy<<<(N+255)/256, 256>>>(N, 2.0f, d_x, d_y);
cudaMemcpy(y, d_y, N*sizeof(float),
           cudaMemcpyDeviceToHost);

cudaFree(d_x);
cudaFree(d_y);
free(x);
free(y);
}
```

MATRIX MULTIPLICATION SERIAL

```
//serial
int a[M][P], b[P][N], c[M][N];
for(int i=0;i<M;++i){
    for(int k=0;k<N;++k){
        int sum=0;
        for(int f=0;f<P;++f){
            sum+=a[i][f]*b[f][k];
        }
        c[i][k]=sum;
    }
}
```

MATRIX MULTIPLICATION KERNEL- OPENCL

```
__kernel void matrixmult(uint widthA,
                          __global const int* inA,
                          __global const int* inB,
                          __global int *out){
    int i=get_global_id(0);
    int j=get_global_id(1);
    int outWidth=get_global_size(0);
    int outHeight=get_global_size(1);
    int sum=0;
    for(int k=0;k<widthA;++k){
        sum+=a[i*widthA+k]*b[k*outWidth+j];
    }
    out[i*outWidth+j]=sum;
}
```

REDUCTION KERNEL- OPENCL

```
__kernel void minum(__global const int* inA,
                    __global int sum,
                    __local int* tmp){
    int i=get_global_id(0);
    int n=get_global_size(0);
    tmp[i]=in[i];
    barrier(CLK_LOCAL_MEM_FENCE);
    for(int k=n/2;k>0;k=k/2){
        if(i<k){
            tmp[i] +=tmp[i+k];
        }
        barrier(CLK_LOCAL_MEM_FENCE);
    }
    if (i==0) sum=tmp[0];
}
```
